

US Health Insurer finds Pain Relief with SmartIS

Pennsylvania

A major US Health Insurer upgraded their home-grown internal cross-reference/inventory system with SmartIS from SEGUS Inc.

The reason for the change, was to update an aging solution that no longer met the organization's needs, or could be maintained effectively. Keeping the old system up-to-date was consuming more and more time and expense.

"With the continual upgrades to our z/OS systems, as well as our own application base, our in-house system was not viable any longer" the head systems engineer stated.

"Over the years, our resources have grown "thin", and keeping the most relevant information up-to-date has been a challenge for us."

Most companies today experience a similar dilemma when trying to maintain effective meta-data about the systems in their data center. SmartIS allows companies to build a comprehensive data repository, providing fast information about all systems within the enterprise.

SmartIS allows all information, such as, JCL, SMF, Job Scheduler, Source Code, DB2, IMS, DISK/TAPE Management—and much more—to be scanned and stored in a DB2 repository. Even though these data sources may be from systems developed by separate vendors, SmartIS reads these and correlates the information.

One Remedy for All

Diverse groups such as Application Developers, Production Control and Scheduling, Operations, etc. can view the data, and the relationships between the separate data sources.

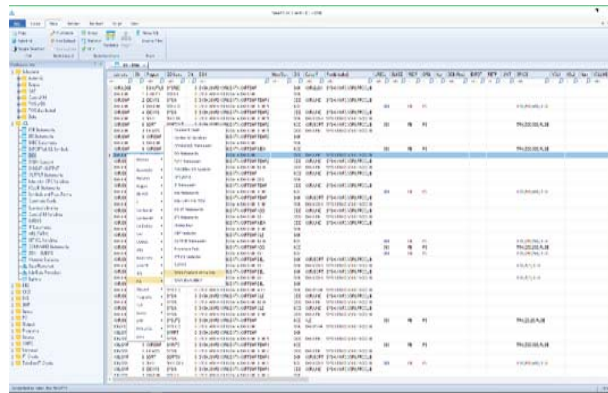

All data remains current—and accurate—so users can be confident when researching items, whether this is for a major project or simply to double-check items on a daily basis.

“SmartIS has greatly shortened our project durations by eliminating much of the old-fashioned and slow research that was provided by our former tool.”

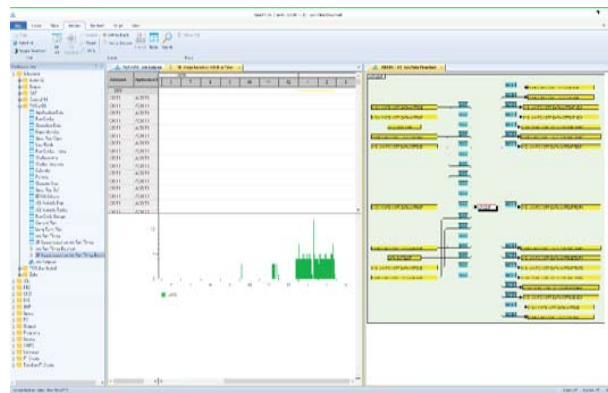

“In addition, our users have given positive feedback on being able to check items we have never tracked before or were inconsistent.”

SmartIS is an open system that allows companies to form their own solutions and add them to the database—thus giving a truly comprehensive view of the enterprise assets.
